BROCHURE NOTES:

Specifications shown were in effect when published. Since errors or omissions are possible, contact your sales representative or the sales department for the most current specifications before ordering. Dynex reserves the right to discontinue products or change designs at any time without incurring any obligation.

PUMP DESCRIPTION

Fixed displacement checkball pumps, with bi-directional shaft rotation, provide constant direction of output flow regardless of the direction of drive shaft rotation.

Mounting

S.A.E. E 4-bolt pattern with 0.25 inch (6,4 mm) pilot engagement;

Shaft Options

Standard keyed shaft, 1.750 inch (44,45 mm) diameter;

Optional spline shaft, 1.748/1.747 inch diameter standard S.A.E. 13 tooth, 8/16 D.P. 30° involute spline. Contact the sales department for model number.

Outlet Port Options

Higher pressure models (PF6023, PF6033 and PF6046) require an outlet port block kit. Refer to page 27. Standard pressure models (PF6054, PF6070 and PF6080) have outlet ports with a pattern for standard 1 inch S.A.E. 4-bolt flange.

Inlet Conditions

Pumps may require pressurized inlet conditions at higher speeds. Failure to meet minimum inlet requirements will result in slight flow reduction. Refer to the table.

Seal Options

Standard seals are Fluorocarbon (Viton® or Fluorel®) with high-pressure shaft seal. Contact the sales department for other seal options.

Weight (Mass)

PF6023, PF6033 and PF6046:
240 lb (109 kg);

PF6054, PF6070 and PF6080:
330 lb (150 kg).

Specifications

Pump Models	Output Flow at 1500 rpm ^①		Output Flow at 1800 rpm ^①		Rated Pressure		Maximum Intermittent Pressure ^②		Rated Speed rpm	Maximum Speed rpm

① Output flow based on typical performance at rated pressure with pressurized inlet where required, as shown in the table below.

② Contact the sales department for applications requiring higher intermittent operating pressures.

③ High pressure Coned and Threaded outlet port uses Autoclave Medium Pressure, Butech M/P or equivalent fitting. Refer to "Outlet Port Block Kits" on page 27.

④ B.S.P. outlet port uses British Standard Pipe fitting. Refer to "Outlet Port Block Kits" on page 27.

Minimum Inlet Pressure^①

Pump Models	Operating Speed							
	1200 rpm		1500 rpm		1800 rpm		2400 rpm	
	psi	bar	psi	bar	psi	bar	psi	bar
PF6023	0	0	5	0,4	10	0,7	–	–
PF6033	0	0	10	0,7	15	1,0	–	–
PF6046	0	0	5	0,4	10	0,7	–	–
PF6054	0	0	5	0,4	5	0,4	10	0,7
PF6070	0	0	5	0,4	10	0,7	10 ^②	0,7 ^②
PF6080	5	0,4	5	0,4	10	0,7	15 ^②	1,0 ^②

① Values shown are based on fluid viscosity of 100 SUS (20 cSt). All PF6000 Series pumps have a high-pressure shaft seal.

② Refer to maximum speeds indicated in the "Specifications" table.

PUMP SELECTION

The "Specifications" table lists the most commonly used standard models with keyed shafts. Contact the sales department for model numbers with spline shafts, optional seals and other extraordinary operating requirements.

Maximum Pressure

Checkball pumps are especially suited for applications susceptible to excessive pressure spikes.

The intermittent pressures listed are the maximum pressures a pump can sustain for occasional, short periods of operation without appreciably reducing life expectancy.

Split-Flow® Provides Multiple Outlets

Split-Flow® models efficiently supply flows for multiple function circuits.

PF6000 Series models are available with individual piston outputs grouped together in the barrel or cover. Various piston flow splits are available in this ten-piston pump.

Models PF6033 and PF6046 are also available with isolator valves, to separate one or more pistons from the main outlet. Up to ten independent flows are possible from these ten-piston pumps. When using isolator valves, high-pressure models are limited to a maximum pressure of 6000 psi (420 bar).

Contact the sales department for Split-Flow® options and availability.

PF6000 SERIES

Typical Performance Curves

Typical performance curves are based on 100 SUS (20 cSt) mineral oil with pressurized inlet where required. Refer to the "Minimum Inlet Pressure" table on page 25.

INSTALLATION

All dimensions are shown in inches (millimeters in parentheses) and are nominal. Refer to page 25 for optional spline shaft data. Refer to Bulletin PSI.CB for general installation and operating recommendations.

Models PF6023, PF6033 and PF6046

The drawing shows dimensions common to these models. Note, however, that Model PF6023 has eight pistons, rather than ten.

As shown, the outlet port on these high-pressure models is machined in a block, which mounts axially on the pump barrel.

The block is not included with the pump. A kit, which includes mounting bolts and o-rings, must be ordered separately. Refer to the table and to "Outlet Port Configurations" on page 29 to specify the port.

Models PF6054, PF6070 and PF6080

As shown, these models have an auxiliary inlet port in the cover, which provides more fluid to improve the filling of the piston pumping chambers. Use of this port will increase volumetric efficiency.

The drawing shows dimensions common to these three models. Note, however, the different dimensions for the outlet port and the overall length for model PF6080.

Outlet Port Block Kits

Port Type	Kit Number
<i>Model PF6023:</i>	
Coned and Threaded ^①	KP60239131
<i>Models PF6033 and PF6046:</i>	
No. 16 S.A.E. ^②	KP60339132
Coned and Threaded ^①	KP60339133
G 3/4 (B.S.P.) ^③	KP60339134

- ① High pressure outlet port uses Autoclave Medium Pressure, Butech M/P or equivalent fitting.
- ② Not recommended for operation above 8000 psi (560 bar). Contact the fitting manufacturer for the pressure rating of the fitting.
- ③ Outlet port uses British Standard Pipe fitting. Not recommended for operation above 10 000 psi (700 bar).

Models PF6023-3167, PF6033-3169 and PF6046-3174

Models PF6054-2946, PF6070-3186 and PF6080-2989

FLUID RECOMMENDATIONS

Mineral Oil

A high-grade premium petroleum-based fluid should be used to assure long component and system life. The fluid should have a combination of anti-wear, demulsibility, rust protection, oxidation-resistant and foam-resistant properties.

Special Fluids

Various pump models are available for use with water-based fluids, diesel calibration fluids, phosphate ester fluids, machining coolant, brake fluid, various military fluids and other special fluids.

PF4300 Series pumps are compatible with a variety of water-based fluids. These models, which are specifically rated for use with low-lubricity fluids.

Some pump models may require reduced operating pressures when using low-lubricity fluids.

Because of the wide range of fluid characteristics, contact the sales department for a review of any application using non-petroleum based fluids.

Viscosity Specifications

Using fluid with the correct viscosity range is critical to achieving long component life.

Fluid conditions outside the "Optimum" range shown in the table may result in reduced pump output, requiring pressurized inlet conditions. For more information, contact the sales department.

Hydraulic Fluid Viscosity^①

Pump Models	Operating				Start-up ^②		Optimum		
	Minimum		Maximum		SUS	cSt	SUS	cSt

^① Fluid conditions outside the "Optimum" range may result in reduced output, requiring pressurized inlet conditions. Contact the sales department.

^② Models with special mounting.

MINIMUM FILTRATION LEVELS

Pump inlet: 150 μ nominal;

Pressure or return line: 25 μ nominal.

While finer filtration levels than these are desirable and will result in longer component life, restricting flow to the pump inlet should be avoided. Minimum recommended inlet conditions must be maintained.

If a system component fails resulting in fluid contamination, it is important to drain and clean the reservoir, all lines, filter screens and all components. Refill with new fluid.

INSTALLATION AND OPERATION

Refer to separate Bulletin PSI.CB for general installation and operating recommendations.

That brochure includes information on mounting, shaft loading, sizing inlet pipe and hose, air bleed procedures and initial start-up. Guidelines for maintenance, repair and trouble-shooting are also included.

PORT DESCRIPTIONS

Dynex pumps are available with outlet ports suitable for use at various pressure ranges. Refer to the appropriate "Specification Table" or "Typical Model Code" to specify the required port.

Contact the fitting manufacturer to ensure the selected fittings are rated for the maximum pump operating pressure.

S.A.E. Straight Thread Ports

Typical S.A.E. Straight Thread port connection

The Straight Thread connection (S.A.E. J1926/1) is sometimes referred to as an S.A.E. O-ring Boss, or ORB. The port consists of a machined spotface surface, a tapered seal cavity and a straight thread port.

The fitting forms a seal by compressing the o-ring in the seal cavity with the underside of the flanged wrench flat. Some adjustable fittings, such as elbows and tees, use a locknut with a captive backup washer for compression.

S.A.E. Straight Thread ports are not recommended for operation above 8000 psi (560 bar). Also, the maximum pressure of pumps with No. 12 S.A.E. outlet ports may be limited by the pressure rating of the available fitting. Contact the fitting manufacturer for ratings.

Coned and Threaded Ports

Typical Coned and Threaded port connection

High-pressure pumps are available with coned and threaded outlet ports, which use Autoclave Medium Pressure, Butech M/P, or equivalent fittings.

These fittings provide a metal-to-metal seal with an interference fit, not requiring an o-ring. The gland nut holds the sleeve and tubing against the cone surface.

A weep hole, visible on the outside of the pump cover, acts as an indicator of any abnormal leakage caused by system conditions (i.e., excessive pressure). It allows any fluid which does leak past the sealing surfaces to escape, preventing pressure build-up and possible damage.

British Standard Pipe Ports

Typical port connection with British Standard Pipe (Parallel) fitting with shoulder

High-pressure pumps are available with flat face ports with British Standard Pipe (B.S.P.) parallel threads (BS 2779 or ISO 228), ideal for use on some European applications.

The fitting forms a seal by compressing a flat elastomer ring on a machined spotface surface. There are several sealing methods for these ports.

The recommended fitting has a recessed seal cavity formed by a shoulder on the underside of the flanged wrench flat (Voss "Peflex", Form B Shoulder Seal; or Parker Type E, "Elastic" Seal; or equivalent).

B.S.P. ports are not recommended for operation above 10 000 psi (700 bar). Contact the fitting manufacturer, to ensure the selected fittings are rated for the maximum pump operating pressure.

S.A.E. 4-Bolt Flange Ports

Typical S.A.E. 4-Bolt Flange port connection

Flange connections are often used for higher flows requiring larger diameter tubing. The port consists of an unthreaded port with four bolt holes in a rectangular pattern on a machined face around the port (S.A.E. J518).

A typical fitting consists of a flanged head with a welded tube and a captive flange with bolt holes. A seal is formed by an o-ring in the groove on the underside mounting surface of the flange head. As the flange bolts are alternately tightened, the o-ring is compressed between the flange head and the machined face on the pump.

To make mounting easier in tight spaces a two-piece split-flange is often used.
